Protecting Your Critical Assets

# Challenges in Oil Analysis

- Selecting the right tests for the oil/application
  - Make sure the right methods are employed
  - Bundled packages may substitute an inferior method to provide a lower cost offering
- Selecting the right condemning limits for your application
- Collecting a representative, uncontaminated sample
- Test repeatability and reproducibility
  - Consistently use the same lab and same methods

# Water Contamination Analysis

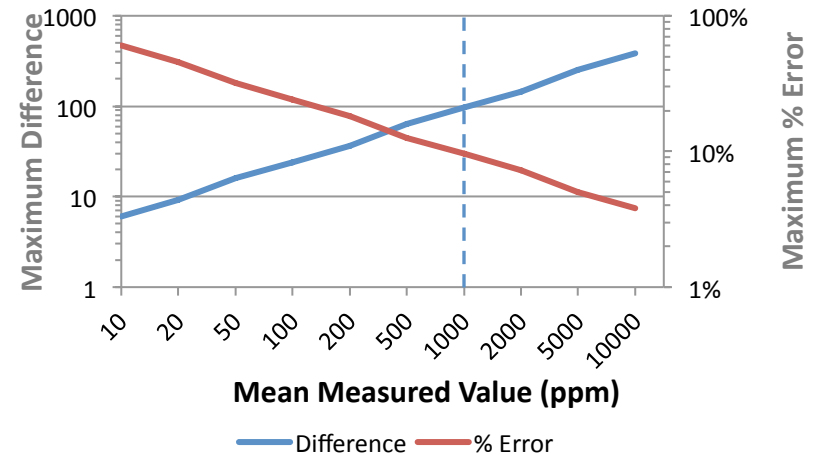

- Many ways to evaluate water contamination
  - Visual, crackle test, calcium hydride kits, Dean and Stark method, FTIR, volumetric titration, coulometric titration
- Most recommended method is ASTM D6304 method C – Coulometric Karl Fischer Titration with Codistillation
- Provides measure of water in a sample in units of mg/kg (ppm)
- Surprisingly poor repeatability and reproducibility tolerances
  - *Repeatability* =  $0.03813 * X^{0.60}$
  - *Reproducibility* =  $0.4243 * X^{0.60}$
  - X is the mean measured value of a sample in %

# ASTM D6304 Reproducibility/ Repeatability

Lab-to-Lab Reproducibility  
(95% Confidence)

Repeatability (Same Lab, Equipment,  
and Operator - 95% Confidence)

- These calculations estimate best case and worst case tolerances for a sample
- E.g. 1000ppm sample
  - Lab-to-lab range is +/-532ppm
  - Measurement-to-measurement range is +/-48ppm
- Even using the same lab, infrequent sampling can push expected tolerances toward reproducibility numbers

# Example Lab-to-Lab Variability

- 14 identical samples split between two labs
- Same ASTM test method specified for both labs
- Major discrepancy in the two sets of results

# Benefits of Online Water Contamination Monitoring

- Get detailed insight to daily/seasonal fluctuations in water contamination levels
  - Is your lubricant staying sufficiently dry?
  - Are your current defenses sufficient?
- Detect water intrusion events when they occur
- Identify units with malfunctioning breathers and/or dehydrators
- Proactively address water contamination problems before they impact lubricant performance

# Offline Analysis: Iron Concentration

- Iron concentration values trend with age of oil
  - Particles “seen” by ICP are sub  $3\mu\text{m}$
  - Filter does not remove particles this small
- Useful for evaluating the health of the lubricant but not the equipment

Oil Analysis Trends from 2 Faulted and 2 Healthy Turbines

# Offline Analysis: Iron Concentration

- Normalize by oil age to evaluate rate of iron generation
- Decreasing trend over time as gearbox surfaces smooth
- Could be useful for filter performance analysis
- Not useful for gearbox health analysis

Turbine A, B are faulty  
Turbine C, D are healthy

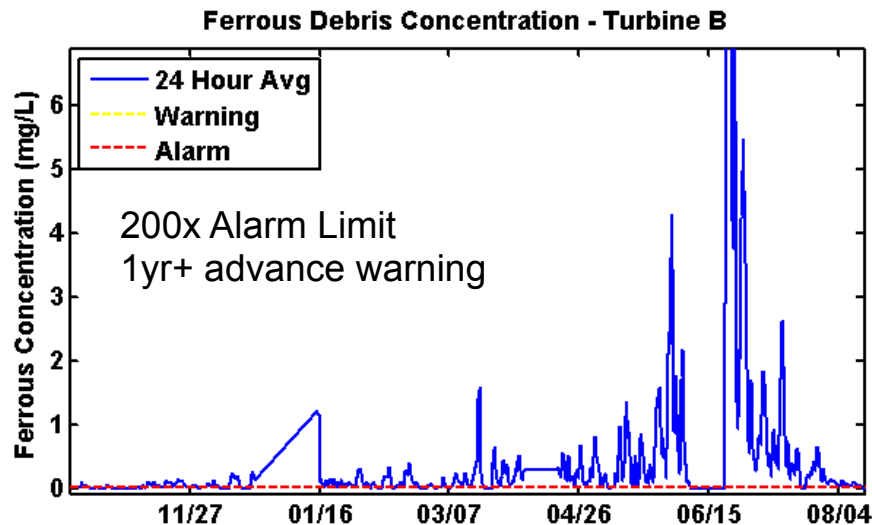

# Offline Analysis: Particle Count

- Offline particle count shows similar lack of information
- Results are confounded by nonmetallic contaminants
- Latest samples to the right indicate the two faulty turbines are healthier than the two healthy turbines!

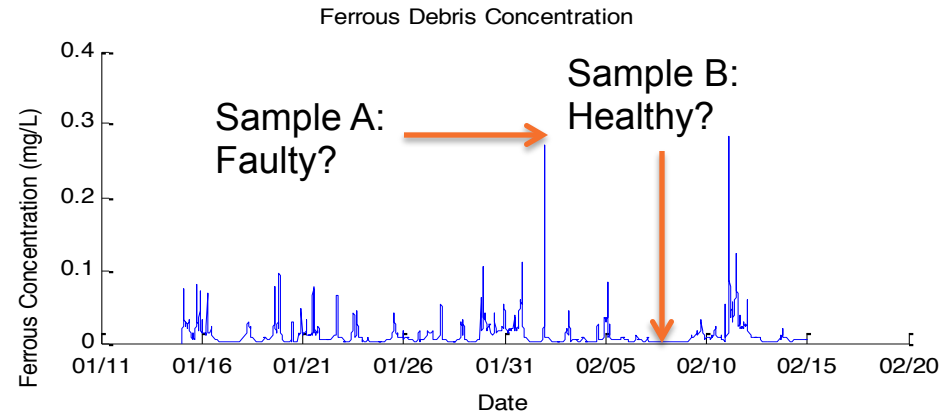

<b>Turbine A</b>	Feb-12	May-12	Mar-13	Sep-13
25-50µm	450	405	946	180
50-100µm	90	30	165	45
100µm+	15	0	15	0
<b>Turbine B</b>	Sep-11	Mar-12	Jun-12	Mar-13
25-50µm	135	255	1471	180
50-100µm	0	0	45	15
100µm+	15	0	0	15
<b>Turbine C</b>	Aug-11	Jan-12	Feb-13	Aug-13
25-50µm	135	300	586	1096
50-100µm	0	60	0	165
100µm+	0	15	0	120
<b>Turbine D</b>	Jan-12	Jul-12	Feb-13	Aug-13
25-50µm	4039	8333	721	405
50-100µm	285	480	45	75
100µm+	15	105	45	30

# Online Wear Debris Monitoring

# Why is Online Monitoring Required for Gearbox Health?

- Wear metal generation is a stochastic process
- Exceedingly low probability of catching wear metal in a small oil sample
  - Probability of catching 1 wear particle greater than 100 $\mu$ m on turbine A in a 4oz sample is less than 1%!
- Impractical to analyze larger samples or sample more often

Wear metal concentrations vary dramatically based on operating conditions. Accurate conclusions cannot be drawn from small samples of oil.

# Combining Online and Offline Monitoring

- The best lubricant health management approach combines online and offline methods
- Use the strength of real-time data to...
  - Reliable monitor asset health
  - Reduce response time
  - Optimize sampling and drain intervals
  - Validate offline analysis
- Use the strength of laboratory analysis to...
  - Provide detailed understanding of lubricant condition and breakdown
  - Verify suitability of the lubricant
  - Validate online analysis
